

Result show Assignment4

Andrew ID: yuzheng

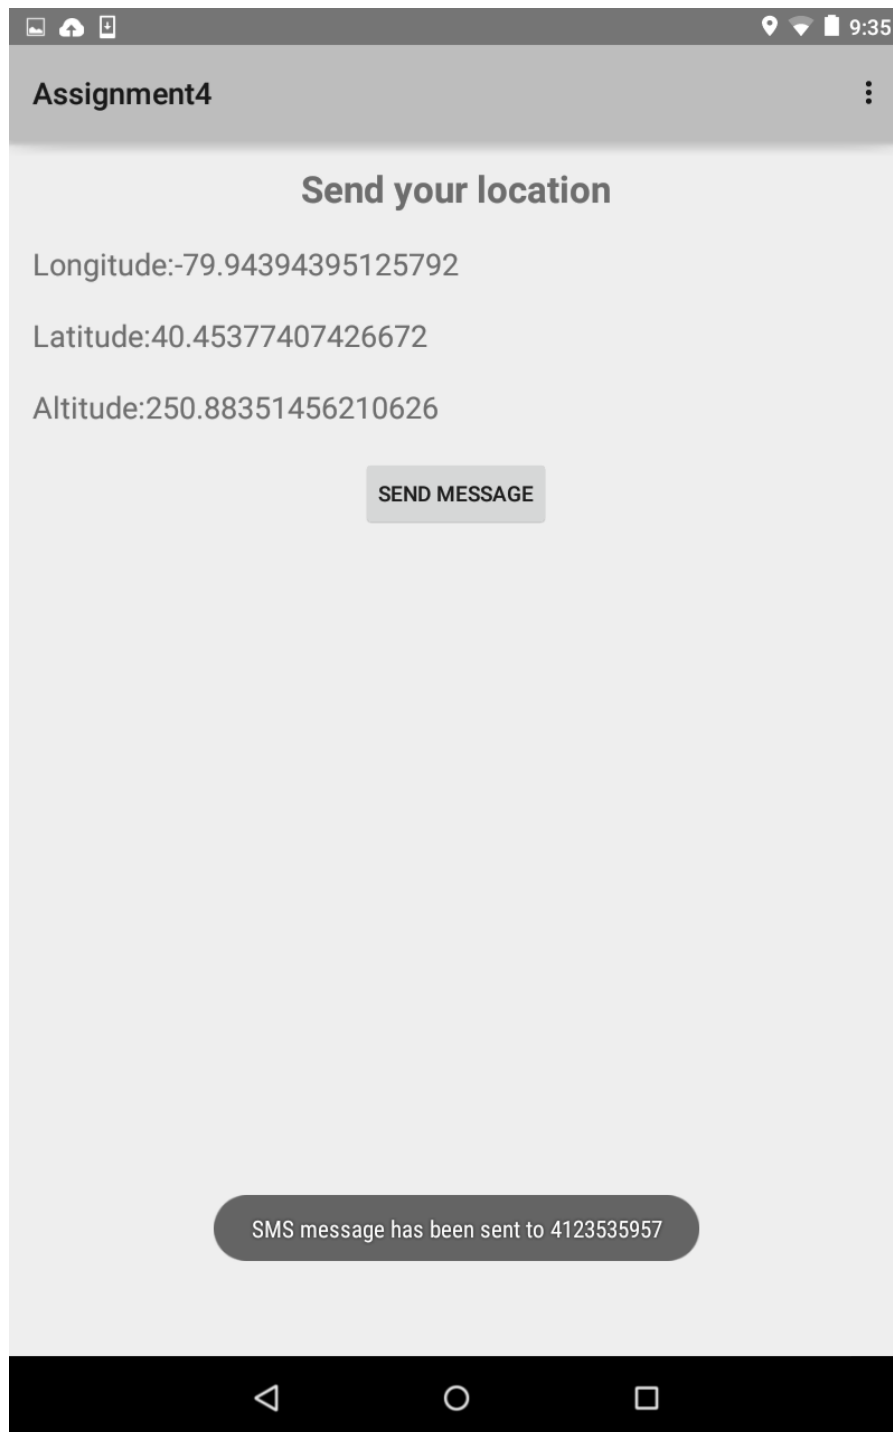

In order save TA'S time, I show the application page flow below:

1. Enter the Main page, you would see the longitude, latitude and altitude.

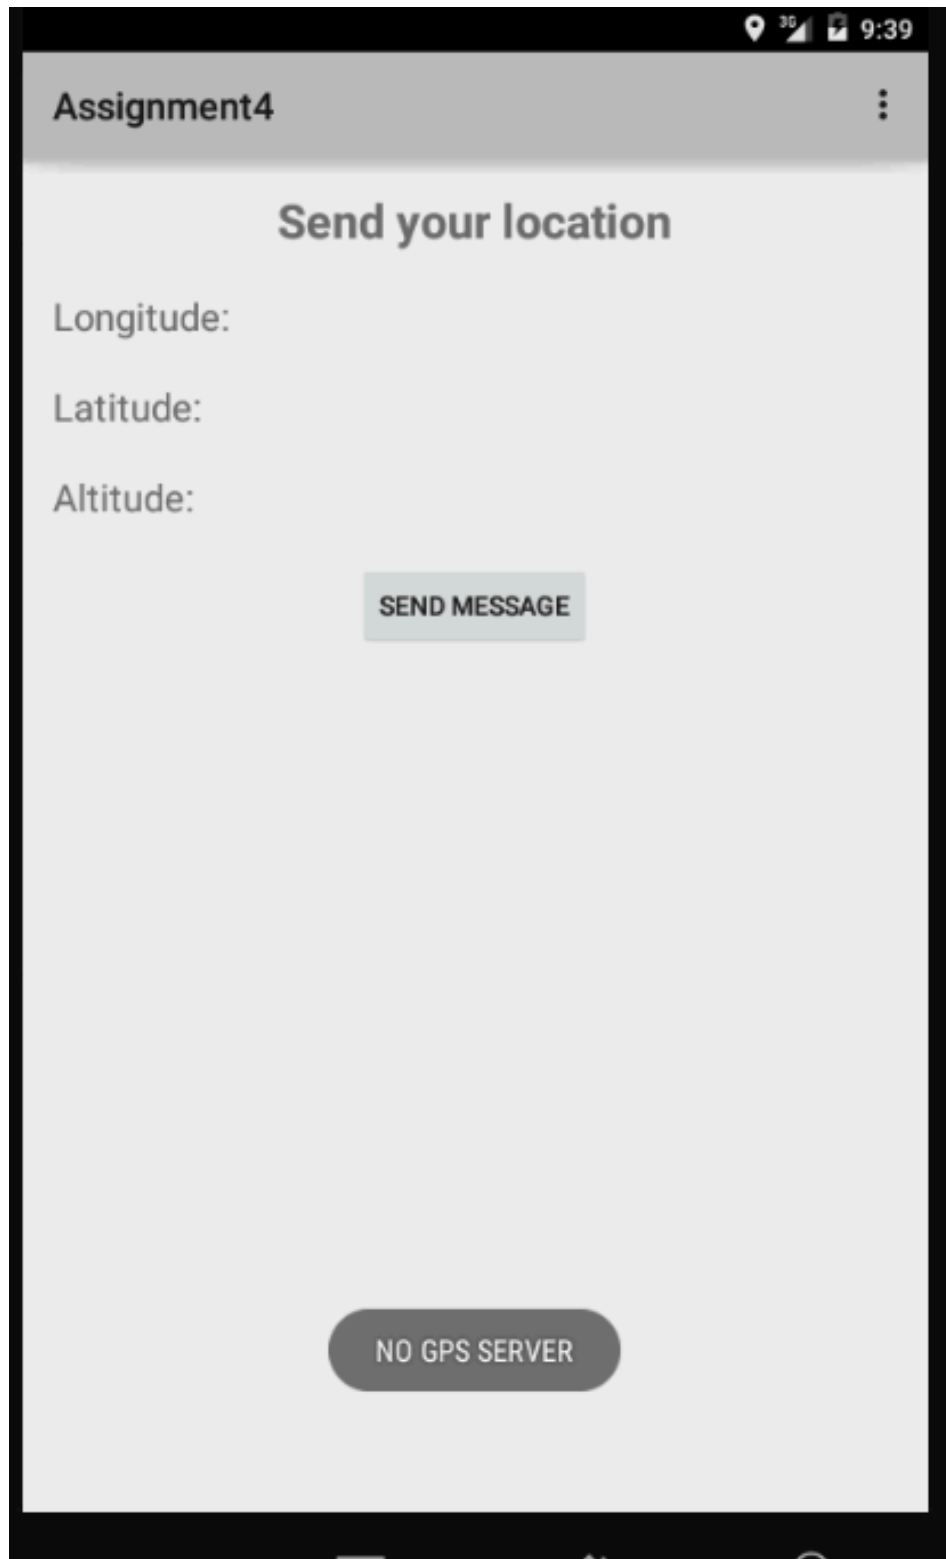

They would update in real time when you change your location.

2. If you click the “SEND MESSAGE” button, the location information would send to a phone as a message. The bottom would show the message has been sent.

3. If there just not location information, the text view would not show any thing, and the bottom would tell you the GPS is not work now.

4. If you still click “SEND MESSAGE” button, the bottom would show the message is fail to send.
